

## Ladder Adder™ Instructions

The primary function of the adjustable Ladder Adder™ is to enable the user to feel steadier on a ladder. This is done by giving the ladder user something other than a wall, ceiling or friend to hang onto.

The Ladder Adder™ is designed for use on **two feet or higher extension or stepladders**. It is to be mounted on rail at least 2-1/4" wide and should not be used on odd shaped or tubular ladder frames and should be mounted on the ladder on the side not used by primary user, i.e. if a person is right handed, the Ladder Adder™ would be mounted on the left side of the ladder as you face it. This will allow you to do the job at hand with your right hand and to steady yourself with your left hand holding onto the Ladder Adder™. Grip the Ladder Adder™ handle by hand and extend to a comfortable height when in use.

When you are done with the Ladder Adder™'s extension, gently squeeze locking plate and top part of bracket and the tube should slide gently to the floor or until handle has gone down as far as possible.
